## **VORTEX BLASTER**

### **Mission Objective:**

Penetrate 5000 Microns of the enemy's vortex field. Reach command centre and destroy it. How far can you penetrate?

### **Important points of play:**

Enemy defences will try to eliminate you as you penetrate deeper into the field. You must keep an eye on your energy banks at all times, if your energy banks should become depleted then you will lose control of your craft, if however they are at a very low level, then your craft will become unstable and very hard to pilot. To recharge your energy banks you must destroy the enemy fuel depots. You will start the game with 1 ship and a shield level of 3. You will receive an extra shield at every 10,000 pts. The game ends when your energy banks are depleted or when you have no shields left. Each time you are hit your shield level will drop by 1. When your shield level reaches zero your craft will be destroyed. Running into the vortex field will destroy your craft and end the game.

### **How to play:**

Use the joystick to control your craft's direction and firing. OR use the keyboard controls:

D — move left

F — move right

↑ — move forward

↓ — move back

**[INS/DEL]** — fire lasers

### **LOADING INSTRUCTIONS:**

1. Turn on the computer.
2. Place the tape into the recorder and rewind it.
3. Type LOAD and press the (CR) key.
4. Press the PLAY button on the recorder.
5. After loading you must immediately type RUN and press the (CR) key.

**NOTE:** On the SEGA SR-1000 data recorder the PLAY button has been replaced by the LOAD button.

If a loading error occurs then rewind the tape and try again from Step 1 with a different volume setting. If you still cannot load the program then use the copy on the other side of the tape.

**IMPORTANT:** You should always rewind the tape after use and place it back into its case, as otherwise this may damage the tape by not doing this.
